- WMS
- Custom Module Apps

SocrateCRM
- Handheld&EDI Integration
- Manufacturing
- Projects & Time Management
- Service Management
- Purchasing
- Materials Management
- Order Management
- Lead Management
- Financial & Performance Management
- Customers History

Efficient and flexible
Industry focused
Short implementation time
Automatic software upgrades
Data and application security
Leanwise implementation methodology
BITSoftware introduces a lean implementation methodology, knowing that the performance of an organization is determined by its construction. That construction model is made of a process model, an interaction model between the actors in the company and an object model of the ‘company world’. Those models provide more transparency about the mapping of the ERP product on the organization, giving everybody much more information about the applicability of the software for the company and the possible gaps in the software that have to be solved. Although models are specific for particular companies, within SocrateERP approach, several models for specific branches/verticals are already developed and available, making the implementation faster and easier.

SocrateERP Architecture
SocrateERP is based on a modularized architecture which provides scalability at highest rates, supporting multiple servers, very large transaction volumes, many users, adaptability, in order to maintain the shortest possible lead time in development and deployment. More than that, on the cloud, there is no downtime, because we can upgrade each module independently on a continuous release management philosophy.

Platform/technology
Independent of the operating system
Databases: Postgres 13.x (provided by Amazon Aurora PostgreSQL)
Technology: J2EE & SOA
Application Server: Tomcat 9.x.
Infrastructure: Amazon Web Services (AWS)
RESTful Web Services
User interface: Ajax-GWT

Rapid development application platform
Quickly build new apps
Easy integration
Workflow and business engines
Modularized architecture
High scalability and availability
Rich Internet Architecture
Web Services & API
